Website Sessions

SEO-Friendly URL

- Keep the URL short, descriptive, and keyword-rich.
- Use hyphens to separate words (e.g., https://www.example.com/seo-optimized-webpage).
- Avoid unnecessary numbers, special characters, and long strings.

Page Title (H1)

- The title should be the primary focus of the page, using your main keyword and being no longer than 60-70 characters.
- Only one H1 tag per page, accurately describing the page content.

Header Tags (H2, H3, etc.)

- Break the content into sections with proper subheadings (H2 for main sections, H3 for sub-sections under H2).
- Use keywords naturally within headings to help search engines understand content hierarchy.

Example:

html

Copy code

```
<h2>1. Why SEO Optimization is Important</h2>
<h3>1.1 Benefits of On-Page SEO</h3>
```

Primary Content (Body Text)

- Ensure the content is comprehensive, useful, and relevant
- Make sure design doesn’t break because of content

External Links

- Include outbound links to high-authority websites related to the topic (where appropriate) to improve credibility and relevance.
- Use the rel="nofollow" tag for any non-trusted or promotional links.

Image

- Use descriptive file names and alt text for images, incorporating keywords.
- Compress images to reduce file size without compromising quality.
- Add Alt tag properly on all images

Page Speed and Performance

- Use lazy loading for images and videos to improve page speed.
- Minimize the use of heavy JavaScript and CSS files.
- Leverage browser caching and compression techniques (GZIP, Brotli).

Breadcrumb Navigation (if applicable)

- Use lazy loading for images and videos to improve page speed.
- Minimize the use of heavy JavaScript and CSS files.
- Leverage browser caching and compression techniques (GZIP, Brotli).

Side Space

- Properly give side space in website as per design
- Create **side-space** class if required
- For top and bottom create **spacing-tb** class

Notes To Follow

- Keep coding structure clean. Make sure to check website on pagespeed for better performance suggestions (https://pagespeed.web.dev/)
- Maintain Code Hygiene in HTML & CSS
  - Don’t use !important if its not required or necessary for that CSS
  - Don’t use unwanted code in HTML, CSS & JS
  - Optimize JS & CSS external files
  - To optimize CSS use below given code:
    <link rel="preload" href="/public/css/fontawesome.css" as="style" onload="this.onload=null;this.rel='stylesheet'">
    <noscript><link rel="stylesheet" href="/public/css/fontawesome.css" /></noscript>
  - To oprimize js team can use async & defer, but please cross check complete website while using as it can give some errors
- Make sure developers don’t use Third Party URL’s
- If there is Third Party URLs use SRI in that (https://www.srihash.org/)

- Optimize images in WebP format (https://compressimage.io/)
  - Normal images should be near 50px-75px
  - Banner image should be max 200px
  - If image quality drops please contact Graphic designer for convert image
- Remove Code comments from Live Website
- If new project start please create a brief documentation for other developers
- While going live, check inspect console and clear all errors
- Use Proper Validation & Captcha code in form
- Use Webm for animation - Contact to Burhan Rasulji
  - Check in all browser if its working properly or not
- Check responsive & functionality in Windows & IOS operating system
